INTRODUCTION TO POS

A point of sale system, or POS, is the place where your customer makes a payment for products or services at your store. Simply put, every time a customer makes a purchase at your store, they're completing a point of sale transaction.

The POS serves as the central component for business; it's the hub where everything—like sales, inventory and customer management—merges.

As evident as the benefits of a POS system are, we found that 56 percent of single-store retailers are not using one. Instead, we found, many are still using a combination of manual methods, cash registers, QuickBooks and Excel for bookkeeping.

So why have retailers not taken that step to POS yet? To begin with, implementing new technology—especially technology that's central to your business process—can be scary and overwhelming. Retailers need to consider the negative consequences of failing to have a POS in place.

“Retailers run the risk of slowing down their operations and missing critical data that could help them grow their business faster. Having key insight about their customers, their inventory level and when they should order more supplies are examples of information a POS provides.”

Understanding a POS system is—its software and hardware components, as well as capabilities—will enable you to make an educated buying decision.

TOOLS AND TECHNOLOGY

Android Studio

- ▶ A project in Android Studio contains everything that defines your workspace for an app, from source code and assets, to test code and build configurations. Android Studio is Android's official IDE.
- ▶ Languages used are XML and Java.

LAMP

- ▶ LINUX
- ▶ APACHE
- ▶ MYSQL
- ▶ PHP

WEBSITE

POS Website is what brick and mortar retailers use to conduct sales. It's sometimes a cash register, computer, or even an iPad where cashiers input your products, tally the cost, and conduct the financial transaction. Most POS Website will also communicate with inventory levels to keep everything in balance. A lot of big box stores have wildly expensive POS solutions, some of which were custom built for their needs. Smaller retailers are moving away from these traditional POS systems and toward cloud based point of sale solutions.

ANDROID APP

It is an efficient billing portal with smart inventory and convenient POS under the name “Smart Retail POS”. It has developed core functionalities for merchant to manage, analyse and visualise inventory. It will help merchant to analyse sales through several reports. It consists of password less-authentication service in the app for users. The highlighted features consist of paper less invoicing, POS profit estimate for instant discount and mobile based wireless barcode scanner.
